

# Internet Reporting & Bandwidth Management

**CIPAFilter's reporting and bandwidth management system allows an administrator to monitor the Internet activity and identify top users and protocols as well as control bandwidth usage and throttle traffic by protocol/IP subnet, or prioritize traffic and provide QOS as needed. This system also provides all the tools necessary to identify what a user's web activity has been, including web-sites visited, key-words used on search engines, and monitor who is tripping the content filter, and much more, in an easy yet effective manner.**

## Internet Reporting System

The reporting system has been designed carefully with the technology director in mind. CIPAFilter wants to provide all the necessary and pertinent information needed to identify inappropriate web-activity, yet keep simplicity in mind. The reporting is a comprehensive system, easily navigated, and very intuitive.

## Bandwidth Control

The CIPAFilter bandwidth control is designed to provide complex bandwidth management needs in an easy-to-manage solution, without difficult configuration parameters and extensive training required. This allows an administrator to allow various speeds for upload and downloads, based on various variables, including common applications such as Chat, P2P, and Audio/Video Streaming. Default common rules are included by default, ensuring the a user will not need to create custom rules for most common traffic, and instead focus on configuration pertaining to their own network.

## Quality of Service

Traffic prioritization and QOS capabilities are built-in, and allow for prioritization of important traffic, such as VOIP or certain Audio/Video Streaming sessions and applications. This will help ensure users do not use bandwidth at the expense of other more important Internet applications.

## Support

Many times computers and devices having problems and causing network delays can be difficult to identify. Our friendly and knowledgeable support staff can help you identify these complex issues and help you solve them. When your network is slow you can simply call us and have us use the advanced diagnostic tools available to identify and many times solve your issues.

See how different  
we really are!

*"I love being able to open the new web reporting feature and see in real time what is being blocked. I am able to see an issue before I am even notified! CIPAFilter is always working to make great improvements."*

*- Colona School District 190, IL*

*"I like knowing that the automatic traffic shaping does a great job prioritizing important traffic without any complex configuration. The bandwidth rules are very easy to configure and I can easily see which computers are using our bandwidth."*

*- S. Michel, District Network Administrator*
